General Description

Micron's RealSSD solid state drive (SSD) uses a single-chip controller with a SATA interface on the system side and n-channels of Micron NAND Flash internally. Packaged in an HDD replacement enclosure, the SSD integrates easily in existing storage infrastructures.

The SSD is designed to use the SATA interface efficiently during both READs and WRITEs while delivering bandwidth-focused performance. SSD technology enables enhanced boot times, faster application load times, reduced power consumption, and extended reliability.

The RealSSD self-encrypting drive (SED) features a FIPS-compliant AES-256 encryption engine, providing hardware-based, secure data encryption, with no loss of SSD performance. This SED follows the TCG/Opal specification for trusted peripherals.

Performance

Measured performance can vary for a number of reasons. The major factors affecting drive performance are the density of the drive and the interface of the host. Additionally, overall system performance can affect the measured drive performance. When comparing drives, it is recommended that all system variables are the same, and only the drive being tested varies.

Performance numbers will vary depending on the host system configuration.

Table 5: Drive Performance

Density	128GB	256GB	512GB	Unit
Interface Speed	6 Gb/s	6 Gb/s	6 Gb/s	
Sequential read (128k transfer)	500	500	500	MB/s
Sequential write (128k transfer)	175	260	260	MB/s
Random read (4k transfer)	45K	45K	45K	IOPs

- Notes:
1. Typical I/O performance numbers as measured using IOMeter with a queue depth of 32 and write cache enabled.
 2. IOMeter measurements are performed on an 8GB span.
 3. 4k transfers used for READ/WRITE latency values.
 4. System variations may affect measured results.
 5. Performance numbers are indicative of C400 firmware version 0009 and newer.

Reliability

Micron's SSDs incorporate advanced technology for defect and error management. They use various combinations of hardware-based error correction algorithms and firmware-based static and dynamic wear-leveling algorithms.

Over the life of the SSD, uncorrectable errors may occur. An uncorrectable error is defined as data that is reported as successfully programmed to the SSD but when it is read out of the SSD, the data differs from what was programmed.

Table 6: Uncorrectable Bit Error Rate

Uncorrectable Bit Error Rate	Operation
<1 sector per 10^{15} bits read	READ

Mean Time Between Failures

Mean time between failures (MTBFs) for the SSD can be predicted based on the component reliability data using the methods referenced in the Telcordia SR-332 reliability prediction procedures for electronic equipment.

Table 7: MTBFs

Density	MTBF (Operating Hours) ¹
128GB	1.2 million
256GB	1.2 million
512GB	1.2 million

Note: 1. The product achieves a mean time between failure (MTBF) of 1.2 million hours, based on population statistics not relevant to individual units.

Endurance

Endurance for the SSD can be predicted based on the usage conditions applied to the device, the internal NAND component cycles, the write amplification factor, and the wear-leveling efficiency of the drive. The table below shows the drive lifetime for each SSD density based on predefined usage conditions.

Table 8: Drive Lifetime

Density	Drive Lifetime (Total Bytes Written)
128GB	72TB
256GB	72TB
512GB	72TB

- Notes:
1. Total bytes written calculated with the drive 90% full.
 2. Access patterns are 50% sequential and 50% random and consist of the following: 5% are 4k; 5% are 8k; 10% are 16k; 10% are 32k; 35% are 64K; and 35% are 128k.
 3. GB/day can be calculated by dividing the total bytes written value by (365 × number of years). For example: 72TB/5 years/365 days = 40 GB/day for 5 years.

Electrical Characteristics

Stresses greater than those listed may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Table 9: SATA Power Consumption

Density	Idle Average	Active Average	Sequential Write/Read Maximum (128k transfer)		Unit
128GB	<85	150	3500	2000	mW
256GB	<85	160	4000	2200	mW
512GB	<100	280	5500	2500	mW

- Notes:
1. Data taken at 25°C using a 6 Gb/s SATA interface.
 2. Active average power measured while running MobileMark® 2007 Productivity Suite.
 3. DIPM (device-initiated power management) enabled.
 4. Sequential power measured in IOMETER MAX with 128KB transfer size.
